

PlankTNT

A bioluminescent projectile made from dinoflagellates.

Here at PlankLIFE, we are committed to ensuring the lives of plankton across the world are monitored and maintained. Due to rising sea temperatures, plankton, especially the bioluminescent dinoflagellates, are at risk in their natural habitats and jeopardise indigenous species where they have migrated. Therefore, we have set up farms across the world to improve population levels in endangered areas and mitigate those that pose a threat. The excess dinoflagellates endangering the plankton in traditionally colder regions have provided an opportunity... PlankTNT. By creating a projectile with the surplus dinoflagellates, we can boost the population in deficient areas while retaining the wonder and colour these creatures create. Bottled at source these plankton can be easily transported across the globe in a safe refrigerated state to their final destination. The PlankTNT kit comes with nine projectiles and one litre of dinoflagellates suspended in water. Envisioned as a seed bomb for the sea, the projectiles are made from nutrient rich sugar glass bombs. They smash like glass with that distinctive sound while the plankton glow a bright blue-green when they strike a surface giving that same sense of danger and awe. Part sparkler, part fun snap, part peony but entirely natural. Providing a sustainable firework that is unlike any other.
